

The program replicate.do reproduces preferred estimates of causal place effects as well as tables and figures from the paper: "The Effect of Neighborhoods on Intergenerational Mobility: Childhood Exposure Effects and County Level Estimates", Part II: Causal Estimates by CZ and County. To run the replication program just run replicate.do in Stata.

The replication ZIP file contains the following folders:

- 1) The data folder contains the complete CZ-level Dataset (Online\_data\_table3.dta) and the complete County-level Dataset (Online\_data\_table4.dta) used by replicate.do. It also contains the percentile to dollar conversion table (percentile\_dollar\_conversion.dta), the preferred estimates of causal place effects by Commuting Zone (Online\_data\_table1.dta) and the preferred estimates of causal place effects by County (Online\_data\_table2.dta) produced by replicate.do.
- 2) The figures folder contains the figures produced by replicate.do
- 3) The tables folder contains the tables produced by replicate.do
